9th International Physical Internet Conference June 13-15, 2023 Athens, Greece

Measuring Efficiency of Automated Road Freight Transport: The AWARD Approach

Presenter: Manuel Walch, MSc

This project has received funding from the European Union's Horizon 2020 research and innovation programme under Grant Agreement No. 101006817. The content of this presentation reflects only the author's view. Neither the European Commission nor the INEA is responsible for any use that may be made of the information it contains.

Expanding the logistics Scope

General Information:									
Project C	oordinator: EasyMile	Partners: 29	Proje	ct Timeline: 01/2021 – 06/2024	Budget: € 26,4m				
	Project Ambitions:		1	Use Cases: UC1: Autonomous loading & unloading forklift operations					
	Develop a unique set of sensors that enables 24/7 availability (night and day, good or bad weather conditions)								
-	Deploy fully automated heavy-duty vehicles in scalable and replicable pilots Integrate a new fleet management system for optimized logistics flows			UC2: Hub-to-hub shuttle service from wareho to logistics hubs	use/production site				
1				UC3: Automated baggage tractor on airsic Gardermoen airport	de in Avinor OSL				
				UC4: Trailer transfer operations and automa Rotterdam Port	ted ship loading in				

Complementary-skilled Consortium from multiple horizons

IPIC 2023

AWARD Global Approach

Able to handle adverse environmental conditions such as heavy rain, snowfall, fog

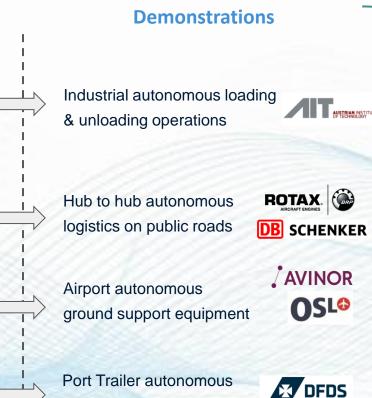

Development of the ADS

Targeting compliance with **ISO 26262** and taking into consideration **SOTIF recommendations**

Integrating multiple sensor modalities and an embedded teleoperation system to address 24/7 availability

Optimized fleet management & supervision system for logistics use cases

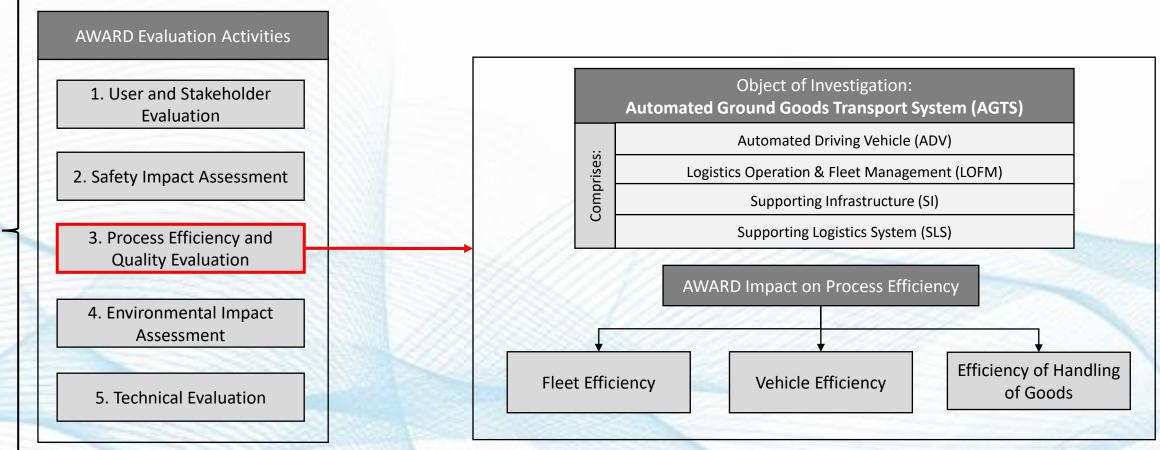

transfer operations

How can the efficiency of these use cases be evaluated?

AWARD Efficiency Evaluation Design (1)

IPIC 2023

Application of FESTA

>

AWARD Efficiency Evaluation Design (2)

	Fleet Efficiency		Vehicle E	fficiency	Efficiency of Handling of Goods				
Focus	Fleet Management System		Automated Driving Vehicle (ADV)		Automated Ground Goods Transport System (AGTS)				
	Financial Indicators								
Impact Categories		Operational Indicators							
categories	Quality Indicators								
	Fuel Costs	Total Costs/KM	Personnel Costs	Vehicle Operation Costs	Personnel Costs	Purchasing Costs for SLS			
KPIs	Vehicle Utilization	Distance Driven	Net Transfer Time	Vehicle Uptime	Operation Costs of SLS	Waiting Times			
	No. of Vehicle Breakdowns	Average Maintenance Downtime	Support Time	Fuel Consumption	Personnel time	Inventory Size			
		Same S	Vehicle Speed	Operational Availability	Timeliness of Handling of Goods	(Un)Loading Time			
			Timeliness of Transport Orders	Transport Reliability					

General Research Questions:

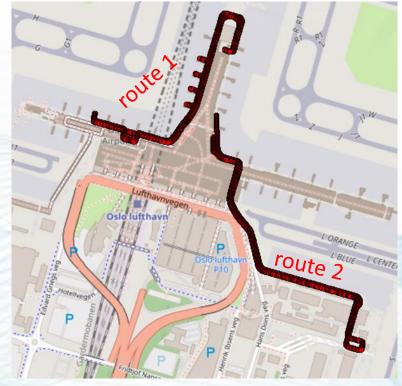

How does the AWARD [Focus] influence [Impact Category]?

Initial Results (UC3 at OSLO Airport) (1)

- Setup:
 - Use of TLD baggage tractor with level 4 automated driving function (incl. integration in FMS)
 - Vehicle accompanied by trained operators who report issues (in logbook) and additional information (i.e. type of stop)
 - 50h of driving on two routes
- Targeted advantages:
 - reduction in number of drivers / solve driver shortage
 - safety improvements
 - better utilization of luggage tractor capacity (supported by the FMS)
 - less driving, if automated vehicle trips are better planned and managed (supported by the FMS)
 - less manual planning with improved fleet management.

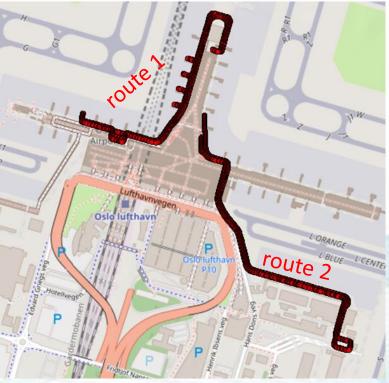

First test routes at Oslo airport

Initial Results (UC3 at OSLO Airport) (2)

- Vehicle speed < speed of human driven tractor
 - 50% more time needed to complete route 1 → route 1 is more complex, with more crossings and traffic participants
 - Only minor time differences for route 2
 - Vehicle still fast enough to complete tasks during plane turnaround time.
- Rain and crossing pedestrians did not significantly impact the tests
- Most common reasons for safety stops were "no obstacle" or "route blocked," often due to baggage carts left by human drivers
- Safety stops required a safety operator or teleoperator to actively support or drive the vehicle for around 5 minutes per operational hour
- No real-life tests have been conducted under harsh weather conditions yet.

First test routes at Oslo airport

Next Steps

- Comprehensive data analysis across different test phases and technological improvements is still necessary (no final results yet)
- The evaluation in Oslo (UC 3) is currently in progress
- In Austria, preparations are being made for Evaluating UC 2 (currently on test track)
- Next month, testing of UC 2 will also take place on public roads
- UC 4 to be tested in Rotterdam by the end of the year
- Use Case 1 will be tested in Seibersdorf in Vienna at the beginning of next year
- Ongoing work will provide further insights into the efficiency of the automated transport vehicles developed for the AWARD use cases.

AWARD Survey #3: Business models

New AWARD survey on automated road transport logistics business aspects

AWARD aims to develop systems for "All Weather Autonomous Real logistics operations and Demonstrations". Currently, we are studying the business aspects related to autonomous logistics operations and need your feedback!

The survey will take approximately 10 minutes to complete.

Autonomous logistics systems are going to disrupt the road transport industry introducing new innovative business models. The goal of this survey is to understand and gain detailed insights into the different business aspects before developing the AWARD's Business Models. We are interested in the opinion of stakeholders related to road transport, industrial environments, ports, airports and other experts.
